Madison 6, Wisconsin

Dear Dr. Lederberg:

As per your request in your letter of December 6, I am sending a small sample of 2-chloro-4-amino benzoic acid. This material has not been tested for bacteriostatic activity so I would suggest that you test it before setting up any large scale experiments. The synthesis does not completely exclude the possibility of contamination with p-amino benzoic acid.

If this material is not active, I shall be happy to replace it with another sample from a different batch.

Sincerely yours,

Frede B. Strandskov
